ACM authors may choose among several rights management options:

- Authors who want ACM to manage the rights and permissions associated with their work, which includes defending against improper use by third parties, can use ACM's traditional copyright transfer agreement.
- Authors who prefer to retain copyright of their work can sign an exclusive licensing agreement, which gives ACM the right but not the obligation to defend the work against improper use by third parties.
- Authors who wish to retain all rights to their work can choose ACM's author-pays option, which allows for perpetual open access of the article through the ACM Digital Library. Authors choosing the author-pays option can choose an appropriate Creative Commons License such as CC-BY or CC0, give ACM non-exclusive permission to publish,

in terms of official publication

Its good to have conference / Journal publication, but it sometimes too much when you had to give all the rights of your own research paper to journal publisher. Even, if author wants to retain copyright, they need to pay a high amount which lead them to give away the copyright

Without uprooting existing framework, why not adopting decentralization in research / academic space.

**** Journal / conference proceedings provide their platform for authors to officially present their work to community. Then they get revenue when different school library purchase the copyright.

**** J/C can provide an incentive to users based on the citation metrics of their paper overtime and provide author a ownership of their work. The incentive can be a form of non transferrable NFT which can not change hands. It represents their academic popularity.

**** While journal / C are dealing with copyright and sell the access to

in terms of preprint/full text research paper sharing

Sharing research paper/preprint with community - like in researchgate authors request for full-text. Giving/revoking access every time, it will be a lot of manual work.

People can only see your PDF fulltext of publication if they are in same research circle and same social circle.

Private and public keypair encryption/ decryption, but need to have ceramics or IPFS to store content

JWT for authentication

Users with certain token token can only see the design idea and publication

- *** Author should have the access all the time to their papers. Upon giving those copyright, there needs to be a transaction in authors account in the block.
- *** Author should have the control to provide access to certain research community based on inclusion rule / social circle.
- *** A continuous progress badge based on citation, read, exposure and social impact
- *** Those badge can be a representative for author in their research community to find similar minded people
- *** Even when they apply for grant, those badge can represent the contribution of this author to the community

privacy app assessment

Hi,

You should have the access of that paper you requested here. Please let me know if you can't access it

https://link.springer.com/chapter/10.1007/978-3-030-50309-3_35

 A. Jiménez to you

Sep 29, 2020

Thanks
